## BMFN 509 - Lab #2

2019.01.31 Bryce Besler

Objectives

· Understand the Fourier Transform · Understand and implement fuguency domain filtering

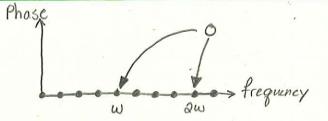

One Dimensional Example Consider adding two essine functions.

Properties of y(+)
Periodic with fugue
Represented using only cosine functions!

We could plot the parameters of each cosine - the magnitude and phase - as a function of frequency.

Magnitude -> frequency

We could express y(t) as the sum of many cosine functions, most with a magnitude of zero.

See Example 1 for concrete examples.

## Generalized Fourier Transform

In general, any function can be represented by a sum of cosine functions.

 $y(t) = \sum_{n=1}^{\infty} A_n \cos(\omega_n t + \emptyset_n)$ The nth component amplitude frequency phase

However, it is more convienient to express the formula using complex exponentials.

Boring

$$cos(\alpha) = \frac{1}{2} \left[ e^{j\alpha} + e^{j\alpha} \right]$$

$$y(t) = \sum_{n=0}^{\infty} A_n \left[ e^{j(\omega_n t + \omega_n)} + e^{-j(\omega_n t + \omega_n)} \right]$$

$$= \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)} + \sum_{n=0}^{\infty} A_n e^{-j(\omega_n t + \omega_n)}$$

$$= \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)} + \sum_{n=0}^{\infty} A_n e^{-j(\omega_n t + \omega_n)}$$

$$= \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)} + \sum_{n=0}^{\infty} A_n e^{-j(\omega_n t + \omega_n)}$$

$$= \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)} + \sum_{n=0}^{\infty} A_n e^{-j(\omega_n t + \omega_n)}$$

$$= \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)} + \sum_{n=0}^{\infty} A_n e^{-j(\omega_n t + \omega_n)}$$

$$= \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)} + \sum_{n=0}^{\infty} A_n e^{-j(\omega_n t + \omega_n)}$$

$$= \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)} + \sum_{n=0}^{\infty} A_n e^{-j(\omega_n t + \omega_n)}$$

$$= \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)} + \sum_{n=0}^{\infty} A_n e^{-j(\omega_n t + \omega_n)}$$

$$= \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)} + \sum_{n=0}^{\infty} A_n e^{-j(\omega_n t + \omega_n)}$$

$$= \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)} + \sum_{n=0}^{\infty} A_n e^{-j(\omega_n t + \omega_n)}$$

$$= \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)} + \sum_{n=0}^{\infty} A_n e^{-j(\omega_n t + \omega_n)}$$

$$= \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)} + \sum_{n=0}^{\infty} A_n e^{-j(\omega_n t + \omega_n)}$$

$$= \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)} + \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)}$$

$$= \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)} + \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)}$$

$$= \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)} + \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)}$$

$$= \sum_{n=0}^{\infty} A_n e^{j(\omega_n t + \omega_n)} + \sum_{n=0}^{\infty} A_n e^{j(\omega$$

y(t) = \( \sum Mn e jon e junt Result

The Fourier Transform takes a signal, y(t), and returns the magnitude - Mn - and phase - Øn - of many cosine functions. Adding these cosine functions reconstructs the signal y(t). The result of the Fourier Transform is:

A complex number, with phase and magnitude

The magnitude and phase change with frequency.

See Example 2.

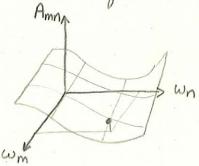

## Fourier Transform for Images

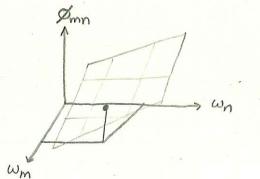

Images are two dimensional signals. As before, we can represent images as a sum of 2D cosine functions.

$$I(x,y) = \sum_{m=0}^{\infty} \sum_{n=0}^{\infty} A_{mn} \cos(\omega_m x + \omega_n y + \emptyset_{mn})$$

amplitude frequencies phase

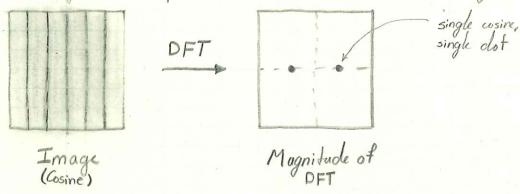

The 2D Fourier Transform gives the components - Amn, Ømn - for various frequencies wm, wn.

See Example 3.

We can visualize the magnitude - Amn - and phase - Ømn - as another image! The intensity of the pixels correspond to the value of the magnitude or phase, which ever you are visualizing.

See Example 4 for real images.

## Frequency Domain Filtering

One important feature of the Fourier Transform is that convolution in the spatial domain is multiplication in the frequency domain

It is standard to denote indexing in the frequency domain with (Kx, Ky), similar to how (x,y) denote spatial indexing.

See Example 5 for visualizing the frequency domain after filtering.

Many imaging systems introduce a blur similar to a Goussian. We may want to uncover this blun with the Frequency domain. We can model a blur as:

Image = Actual \* Blur

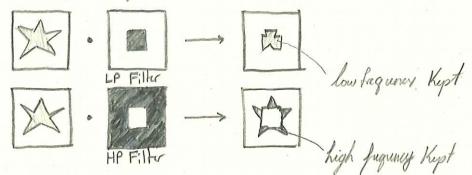

Take the Fourier Transform:

Image = = Actual = · Blurg

Now divide!

See Example 6 for an example of uncovering a gaussian blur.

Finally, we can filter our image data in the frequency domain by multiplication. Consider the following examples:

See Example 7 for an example of applying a filter in the frequency domain.
